## USING WINQSB TO SOLVE LINEAR PROGRAMMING PROBLEMS

## 1. CREATING A NEW LINEAR OR INTEGER PROGRAMMING PROBLEM

The New Problem option generates a template for inserting the characteristics of our problem:

Each of the boxes of this window is described below:

- Problem Title: Enter the title used to identify the problem.
- Number of Variables: Enter the number of system variables in the original model.
- Number of Constraints: Enter the number of constraints of the model (should not include the nonnegative constraint).
- Objective (Objective Criterion): There are two classifications for linear and integer programming problems: Maximization and Minimization problems.
- Data Entry Format: This option allows choosing between two different types of templates for entering model data. The first alternative is similar to a spreadsheet whereas the second is a template specially designed for this purpose.
- Type of Variable (Default Variable Type): The model characteristics are indicated in this section:
- Nonnegative continuous: Indicates that the model consists of nonnegative continuous variables (equal or greater than zero).
- Nonnegative Integer: Nonnegative integer variables.
- Binary: Variables which only have a value of 0 or 1.
- (Unsigned/unrestricted): Unrestricted variables.

## 2. SAMPLE PROBLEM

By means of a sample problem, we will show how data are entered to create a new linear programming problem.

## EXAMPLE

The firm ABC S.A. wants to know the number of $\mathrm{A}, \mathrm{B}$, and C products that it should produce in order to maximise profit taking into account that each unit sold generates a utility of $150 €, 210 €$ and $130 €$ per unit, respectively. Each product goes through 3 different working tables, restricting the number of units produced because of the time available at each of the tables. The following chart shows the time required for each product unit at each table and the total time available during the week (time expressed in minutes):

|  | Required <br> time <br> Table 1 | Required <br> time <br> Table 2 | Required time <br> Table 3 |
| :---: | :---: | :---: | :---: |
| Product 1 | 10 | 12 | 8 |
| Product 2 | 15 | 17 | 9 |
| Product 3 | 7 | 7 | 8 |
| Total available time by <br> table | 3300 | 3500 | 2900 |

It is assumed that each unit produced is sold automatically. Determine the combination of products required to maximise the firm's profit. After analysing the example, the reader will create a mathematical model.

## Decision variables:

$\mathrm{X} 1=$ number of product 1 units to produce
X2=number of product 2 units to produce
X3=number of product 3 units to produce

## Objective Function:

$$
\text { Max. } Z=150^{*} X 1+210^{*} X 2+130^{*} X 3
$$

## Restrictions:

$$
\begin{aligned}
& 10^{*} X 1+15^{*} X 2+7^{*} X 3 \leq 3300 \text { (Minutes) } \\
& 12^{*} X 1+17^{*} X 2+7^{*} X 3 \leq 3500 \text { (Minutes) } \\
& 8^{*} X 1+9^{*} X 2+8^{*} X 3 \leq 2900 \text { (Minutes) } \\
& X 1, X 2, X 3 \geq 0
\end{aligned}
$$

First, we must establish that this is a Maximization product with three constraints and three variables (which we will use as continuous nonnegative variables).

Once this is clear, feed the program from the New Problem window.

After all the fields have been filled in, click on the OK button to generate new options within the program.

## 3. INSERTING THE MODEL

If the Spreadsheet Matrix Form is chosen, a new window will open in the working area to insert the mathematical model.

| Variable --> | X1 | X2 | X3 | Direction | R. H. S. |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Maximize |  |  |  |  |  |
| C1 |  |  |  | < |  |
| C2 |  |  |  | < |  |
| C3 |  |  |  | < |  |
| LowerBound | 0 | 0 | 0 |  |  |
| UpperBound | M | M | M |  |  |
| VariableType | Continuous | Continuous | ontinuous |  |  |

The first row (Variable -->) is the heading of the variables which the system defines automatically as X1, X2 and X3 (the three sample variables), followed by the relationship operator (Direction) and the constraints solution or Right Hand Side -R. H. S. The name of the variables can be changed in the Variables Names submenu from the Edit menu.

| Edit | Format |
| :--- | ---: |
| Cut | Solve and Analyze |
| Copy | Retl+X |
| Paste | $\mathrm{Ctrl+C}$ |
| Clear | $\mathrm{Ctrl+V}$ |
| Undo |  |
| Problem Name |  |
| Variable Names |  |
| Constraint Names |  |
| Goal Criteria and Names |  |
| Insert a Goal |  |
| Delete a Goal |  |
| Insert a Variable |  |
| Delete a Variable |  |
| Insert a Constraint |  |
| Delete a Constraint |  |

The second row (Maximize) is for inserting the coefficients of the objective function. Several rows identified with the letter $\mathbf{C i}$ will appear followed by a consecutive corresponding to the number of constraints of the model (C1 indicates "Constraint 1", etc.)

| C1 |  |  |  | $<=$ |  |
| :--- | :--- | :--- | :--- | :--- | :--- |
| C2 |  |  |  | $<=$ |  |
| C3 |  |  |  | $<=$ |  |

Lastly, three rows appear where the minimum accepted value for each variable (Lower Bound), the maximum value (Upper Bound) and the type of variable (Variable Type) are defined. In the case of the maximum value, $\boldsymbol{M}$ means that the variable can receive very large values (tending to be infinite).

## 4. THE SAMPLE MODEL

To enter the model proposed in the example, firstly insert the coefficients of the objective function in the second row:

| Variable --> | X1 | X2 | X3 | Direction | R. H. S. |
| :--- | ---: | ---: | ---: | ---: | ---: |
| Maximize | 150 |  | 210 | 130 |  |
|  |  |  |  |  |  |

Then enter the coefficients of the constraints $\mathrm{C} 1, \mathrm{C} 2$ and C 3 :

| C1 | 10 | 15 | 7 | $<=$ | 3300 |
| :--- | ---: | ---: | ---: | ---: | ---: |
| C2 | 12 | 17 | 7 | $<=$ | 3500 |
| C3 | 8 | 9 | 8 | $<=$ | 2900 |

To change the relationship operators, click twice on top using the left-hand side of the mouse. The other rows remain unchanged.

## 5. SOLVING THE PROBLEM

After inserting the model in the template, use the tools provided in the Solve and Analyze menu. The menu offers the following options:

## Solve and Analyze Results Utilities Wir

Solve the Problem
Solve and Display Steps
Graphic Method
Perform Parametric Analysis
Alternative Solution
Change Integer Tolerance
Specify Solution Quality
Specify Variable Branching Priorities

- Solve the Problem: Solves the problem by using the Simplex Primal method. It shows the final complete solution.
- Solve and Display Steps: Shows each of the steps or interactions performed by Simplex until achieving the optimal solution.
- Graphic Method: Solves the linear programming problem using the graphic method (for problems using two variables).

For the example problem, select the first option in the Solve and Analyze menu. A small window will pop up with the message: "The problem has been solved. Optimal solution is achieved".

Click on the Accept button and the program will automatically generate the optimal solution.

| Decision Variable | Solution Value | Unit Cost or Profit c(i) | Total Contribution | Reduced Cost | Basis Status | Allowable Min. c(i) | Allowable Max. cil |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| X1 | 0 | 150.0000 | 0 | -14.9315 | at bound | -M | 164.9315 |
| X2 | 105.4795 | 210.0000 | 22,150.6900 | 0 | basic | 182.7500 | 315.7143 |
| X3 | 243.8356 | 130.0000 | 31.698.6300 | 0 | basic | 91.0714 | 186.6667 |
| Objective | Function | (Max. $)=$ | 53,849.3200 |  |  |  |  |
| Constraint | Left Hand Side | Direction | Right Hand Side | Slack or Surplus | Shadow Price | Allowable Min. RHS | Allowable <br> Max. RHS |
| C1 | 3,289.0410 | < | 3,300.0000 | 10.9589 | 0 | 3,289.0410 | M |
| C2 | 3,500.0000 | < $=$ | 3,500.0000 | 0 | 6.9863 | 2,537.5000 | 3,514.0350 |
| C3 | 2,900.0000 | < | 2,900.0000 | 0 | 10.1370 | 1,852.9410 | 2,957.1430 |

## 6. UNDERSTANDING THE RESULTS (COMBINED REPORT)

This matrix displays sufficient information on the solved model. The upper section relates to the analysis of the defined variables (X1, X2 and X3).

| Decision Variable | Solution Value | Unit Cost or Profit c(i) | Total Contribution | Reduced Cost | Basis Status | Allowable Min. c(i) | Allowable Max. c(i) |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| X1 | 0 | 150.0000 | 0 | -14.9315 | at bound | -M | 164.9315 |
| X2 | 105.4795 | 210.0000 | 22,150.6900 | 0 | basic | 182.7500 | 315.7143 |
| X3 | 243.8356 | 130.0000 | 31,698.6300 | 0 | basic | 91.0714 | 186.6667 |
| Objective | Function | (Max. ${ }^{\text {a }}$ | 53.849.3200 |  |  |  |  |

The Solution Value column displays the optimal values that were found. In this example, X1 represents 0 units, X2 105.4795 units and X3 is 243.8356 units.
The Unit Cost or Profit column displays the initial coefficients of each variable in the objective function.

The Total Contribution column displays the cost or profit (or whatever the objective is) generated by each variable. For example, as the value of the X2 variable is 105.4795 units and the profit per unit is $210 €$, the total profit will be the result of multiplying both values, arriving at the figure of $22,150.69 €$. The optimal objective value ( $53,849.32 €$ ) appears just below the last contribution.

The Reduced Cost column identifies the cost generated by increasing one unit for each at bound variable. The following column, Basis Status, indicates if a variable is basic or non basic (indicating that it's non basic as at bound).

The following section of the final matrix (Constraints Summary), displays the system's dummy variables (slack or surplus).

|  | Constraint | Left Hand <br> Side | Direction | Right Hand <br> Side | Slack <br> or Surplus | Shadow <br> Price | Allowable <br> Min. RHS | Allowable <br> Max. RHS |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathbf{1}$ | C1 | $\mathbf{3 , 2 8 9 . 0 4 1 0}$ | $<=$ | $\mathbf{3 , 3 0 0 . 0 0 0 0}$ | $\mathbf{1 0 . 9 5 8 9}$ | 0 | $\mathbf{3 , 2 8 9 . 0 4 1 0}$ | M |
| $\mathbf{2}$ | C2 | $\mathbf{3 , 5 0 0 . 0 0 0 0}$ | $<=$ | $\mathbf{3 , 5 0 0 . 0 0 0 0}$ | 0 | 6.9863 | $2,537.5000$ | $\mathbf{3 , 5 1 4 . 0 3 5 0}$ |
| $\mathbf{3}$ | C3 | $2,900.0000$ | $<=$ | $2,900.0000$ | 0 | 10.1370 | $1,852.9410$ | $2,957.1430$ |

The Left Hand Side column displays the value achieved by replacing X1, X2 and X3 values in each restriction (bear in mind that each restriction is identified with its corresponding dummy variable).

The following two columns (Direction and Right Hand Side) display the specifications given to the constraints in terms of the relationship operator ( $\leq$ ) and the original values of the constraints (3,300, 3,500 and 2,900 minutes).

The Slack or Surplus columns show the values of the dummy variables and the Shadow Price column relates to the shadow prices: how much would you be willing to pay for an additional unit of each resource?

## 7. THE FINAL SIMPLEX TABLE

WINQSB makes it possible to display the optimal results by means of the format applied by the Simplex method. To be able to display this format, once the problem has been solved, select the Final Simplex Tableau option from the Results menu.

|  |  | $X 1$ | $X 2$ | X3 | Slack_C1 | Slack_C2 | Slack_C3 |  |  |
| :---: | :---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: |
| Basis | $C(i)$ | 150.0000 | 210.0000 | 130.0000 | 0 | 0 | 0 | R. H. S. | Ratio |
| Slack_C1 | 0 | 0 | -0.9041 | 0.0000 | 0.0000 | 1.0000 | -0.7808 | -0.1918 | 10.9589 |
| $X 2$ | 210.0000 | 0.5479 | 1.0000 | 0.0000 | 0 | 0.1096 | -0.0959 | 105.4795 |  |
| $X 3$ | 130.0000 | 0.3836 | 0.0000 | 1.0000 | 0 | -0.1233 | 0.2329 | 243.8356 |  |
|  | C(i)-Z(i) | -14.9315 | 0 | 0 | 0 | -6.9863 | -10.1370 | $53,849.3200$ |  |
